云南爵床科一新属*

李锡文

(中国科学院昆明植物研究所)

A NEW GENUS OF ACANTHACEAE FROM YUNNAN

LI HSI-WEN

(Kunming Institute of Botany, Academia Sinica)

宽丝爵床属 新属

Haplanthoides H. W. Li, gen. nov.

(Trib. Justicieae Subtrib. Andrographideae)

Genus novum arcte affine *Haplantho* Nees, qui pseudo-verti-cillasteribus ramulis abortivis aphyllis flores superantibus apiceque saepius 2-vel 3-dentatis demum rigidis et fere spinescentibus suffultis, tubo corollae intus haud piloso et glandulosolepidoso, staminibus sub fauce corollae affixis, filamentis complanatis sed haud arcuato-dilatatis, antheris conniventibus subcohaerentibus bene distinguitur.

Herba erecta, subglabra. Folia opposita, ovata vel late ovata, integra, petiolata. Flores parvuli, 3—7 in cymos axillares pedunculatos compositi, cymis tamen in pseudo-verticillasterem contractis. Bracteae et bracteolae lineares vel lineari-lanceolatae. Calyx 5-partitus, segmentis lineari-lanceolatis subaequalibus. Corollae tubus obliquus, prope basin supra saccatus, superne in fauce paulo ampliatus, intus ventre ad medium pilosus et ad labium anticum infra faucem glanduloso-lepidosus; limbus 2-labiatus, labio postico suberecto ad medium 2-lobato lobis late ovatis apice rotundatis, antico subpatente 3-lobato, lobis subaequalibus ovatis apice obtusis, lobis omnibus imbricatis. Stamina 2, infra medium tubi affixa, inclusa, filamentis complanatis ad laterem interiorem prope basin satis arcuato-dilatatis, antheris apice dorsifixis separatis 2-locularibus, loculis ovato-oblongis subaequalibus parallelis v. uno paullo altius affixo muticis, connectivis dorso barbatis. Discus annularis. Stylus apice oblique truncatus; ovula in quoque loculo 10. Capsula oblonga, basi in stipitem solidum contracta. Semina 20 vel abortu pauciora, orbiculata, planocompressa, verruculosa, retinaculis longis fulta.

Typus generis: Haplanthoides yunnanensis H. W. Li

Species unica, in Yunnan australi incolens.

直立草本,近无毛。叶对生,卵形或宽卵形,全缘,具柄。花小,3一7朵组成聚伞花序, 聚伞花序腋生,具梗,于每节上紧缩成假轮伞状;苞片及小苞片线形或线状披针形。花萼5

^{*} 蒙王文采先生审查拉丁文,李锡畴同志绘图,作者敬致谢意。

深裂,裂片线状披针形,近等大。花冠筒斜伸,近基部背面囊大,喉部略增宽,内面前方中部有疏柔毛但下唇下方喉部有腺鳞,冠檐二唇形,上唇近直立,2裂至中部,裂片宽卵形,先端圆形,下唇近平展,3裂,裂片近等大,卵形,先端钝,全部裂片覆瓦状排列。雄蕊2,着生于冠筒下部,内藏,花丝扁平,内侧近基部十分弧状增大,花药顶端背着,分离,2室,室卵状长圆形,近等大,平行,不等高,无芒,药隔背面有髯毛。花盘杯状。花柱先端斜截形;子房每室胚珠 10 枚。蒴果长圆形,基部收缩成粗柄。种子 20 颗或由于败育而较少,圆形,压扁,多疣突,悬着于长珠柄钩上。

属模式: 宽丝爵床 Haplanthoides yunnanensis H. W. Li

一种,产云南南部。

新属无疑与简花爵床属 Haplanthus Nees 相近,但后者假轮伞花序下承有无叶不育枝,这些不育枝坚硬刺状,其长度超出于花序且顶端具 2—3 个小刺,冠筒内无疏柔毛及腺鳞,雄蕊着生于冠筒喉部,花丝扁平,不弧状增大,花药靠合,近连着而不同。

宽丝爵床 新种

Haplanthoides yunnanensis H. W. Li, sp. nov.

Herba erecta, 13-40cm alta. Caulis inferne procumbens et deorsum radices adventitos emittens, quadrangularis, striatulus, viridis, subglaber, simplex vel inferne ramosus, internodiis 1.5-7cm longis. Folia opposita; laminae chartaceae, ovatae vel late ovatae, 2.5-6.5cm longae, 2-5cm latae, apice breve acuminatae vel acutae, basi rotundatae sed in petiolos superne anguste alatos (1) 1.5-2.5cm longos plano-convexos glabros abrupte attenuatae, supra virides, subtus pallidiores, utrinque subglabrae, nervis lateralibus utrinsecus 6-8, satis arcuatis et prope marginem anastomosantibus, ut costa utrinque convexis, venis subtus obscuris. Cymae axillares, 3-7-florae, in pseudo-verticillasterem contractae, pedunculatae, pedunculis 3-7mm longis pubescentibus. Bracteae et bracteolae lineares vel lineari-lanceolatae, c. 2mm longae, 0.3mm latae, dense glanduloso-pubescentes. Pedicelli breves, c. 1.5mm longi, glanduloso-pubescentes. Calyx parvus, campanulatus, c. 4mm longus, extus glanduloso-pubescens, intus glaber, fere ad basin 5-partitus, segmentis lineari-lanceolatis c. 3.8mm longis basi 0.5mm latis apice acuminatis. Corolla alba sed ad labium posticum rubescens vel purpurascens, extus sparse glanduloso-pubescens, intus ventre ad medium tubi pilosa et ad labium anticum infra faucem glanduloso-lepidosa; tubo c. 6.5mm longo, prope basin dorso saccato, ad faucem c. 3mm lato; limbo 2-labiato, labio postico ad medium 2-lobato, lobis late ovatis apice rotundatis, labio antico 3-lobato, lobis subaequalibus ovatis apice obtusis. Stamina 2,3mm supra basin tubi affixa; filamentis c.3mm longis, complanatis, ad laterem exteriorem pubescentibus sed ad laterem interiorem glabris prope basin satis arcuato-dilatatis; antheris c. 1.5mm longis, apice dorsifixis, separatis, 2-locularibus, loculis ovato-oblongis subaequalibus parallelis v. uno paullo altius affixo muticis, connectivis dorso barbatis. Discus annularis, c. 0.7mm altus. Pistillum 6.5mm longum; ovario oblongo, c. 2mm longo, dense pubescente; stylo gracili, pubescente, apice oblique truncato; ovula in quoque loculo 10. Capsula oblonga, 15mm longa, 2mm lata, basi in stipitem solidum contracta, dense pubescens. Semina 20 vel abortu pauciora, orbiculata, plano-compressa, verruculosa, retinaculis longis fulta. Floret Januario—Februario. Fructificat Februario—Martio.

Yunnan: Mengla, Menglun, in monte calcareo prope 56km a Mengyang ad Mengla, Feb. 22, 1959, S. Chow 336 (Typus, KUN); Ibidem, in Bamboo-silvis ad Hortum Botanicum Tropicum, 580m s. m., Feb. 23 1959, S. Chow 357.

直立草本,高13—40厘米。茎下部倚地,向下生不定根,四棱形,有细条纹,绿色,近无毛,不分枝或下部分枝,节间长 1.5—7厘米。叶对生,叶片坚纸质,卵形至宽卵形,长 2.5—6.5厘米,宽 2—5厘米,先端短渐尖至锐尖,基部圆形但骤然收缩成上部具狭翅的叶柄,上面绿色,下面淡绿色,两面近无毛,侧脉每边6—8条,十分弧曲,至近叶缘处网结,与中脉两面凸起,小脉在叶下面隐约可见;叶柄长(1) 1.5—2.5厘米,腹平背凸,无毛。聚伞花序腋生,具3—7花,紧缩成假轮伞状,具梗,总梗长 3—7毫米,被微柔毛; 苞片及小苞片线形或线状披针形,长约 2毫米,宽0.3毫米,密被腺微柔毛; 花梗短,长约 1.5毫米,被腺微柔毛; 花萼小,钟形,长约 4毫米,外被腺微柔毛,内面无毛,5裂至近基部,裂片线状披针形,长约 3.8毫米,基部宽 0.5毫米,先端长渐尖; 花冠白色但上唇带淡红色或淡紫色,外面疏被
